

Idea Title & Proposed Solution

Proposed Solution

A gamified mobile application disguised as an immersive phonics adventure game that screens children for dyslexia during early primary school years.

Core Value: Bypasses clinical psychologist shortages by shifting preliminary diagnostic tracking directly into standard school classrooms.

3-Tiered Architecture

- 1. Gamified Tracking:** Captures touch latency and erratic visual saccades during gameplay.
- 2. Speech & NLP:** Analyzes phoneme substitution and syllable omission in regional Indian languages.
- 3. Teacher Dashboard:** Converts metrics instantly into actionable clinical risk reports.

Technical Approach

Frontend & Game

Flutter cross-platform mobile & tablet framework built for public school device compatibility.

Speech Engine

Offline TensorFlow Lite & Vosk API running locally to evaluate regional phonemes without cloud latency.

Backend & Analytics

Python FastAPI paired with scikit-learn classification models and secure PostgreSQL caching.

Feasibility and Viability

Technical Feasibility

Built using mature open-source audio frameworks, allowing rapid prototyping and local offline execution in remote rural classrooms.

Risk Mitigation

Noise Filtering: Integrated noise suppression filters and headset prompts during voice checks.

Child Fatigue: Wrapped clinical metrics inside rewarding fantasy levels to eliminate test anxiety.

Impact and Benefits

Social Inclusion

Stigma-free early screening for rural children, preventing kids from being mislabeled as slow learners.

Cost Efficiency

Eliminates heavy financial barriers of private clinical assessments for low-income families.

National Alignment

Directly fulfills foundational literacy and inclusive education mandates under the NEP framework.
